

OI-ROOM-001 Printable Walkthrough

Synthetic public-safe walkthrough for evaluating the Operational Intelligence model.

Purpose

OI-ROOM-001 is a public-safe synthetic case showing how evidence, hypotheses, evaluation gates, decision packets, operator approval, and learning work together.

Timeline

Time	Event	Primary Layers	Review output
T0	Normal checkout baseline exists	Signal, Transaction	Baseline window recorded
T1	Checkout latency increases	Signal	Observation E1 opened
T2	Payment authorization hop slows	Transaction, Evidence	Observation E2 attached to hop 3
T3	Related deployment event appears	Signal, Topology	Observation E3 linked to owner and change window
T4	Downstream health check remains normal	Evidence	Contradiction E4 attached to H2
T5	Async trace segment is missing	Evidence, Transaction	Missing evidence E5 attached
T6	Hypotheses are proposed and updated	Reasoning	H1 supported, H2 contradicted, H3 proposed
T7	Rollback review packet is drafted	Decision	Decision packet OI-DP-001 prepared
T8	Operator approval is required	Operator	Owner approves, rejects, escalates, or requests evidence
T9	Outcome becomes replay seed and eval fixture	Learning, Memory, Evaluation	Reviewed result updates memory and fixtures

Transaction hops

Hop	Description	Synthetic timing	Evidence state
1	User initiates checkout	near baseline	Observation
2	Cart validation completes	near baseline	Observation
3	Payment authorization slows	elevated relative to baseline	Observation
4	Dependency boundary checked	downstream health normal	Observation plus contradiction
5	Async confirmation trace	unavailable	Missing evidence
6	Checkout completion	delayed relative to baseline	Confirmed fact after review

Evidence

ID	Type	Statement	Impact
E1	Observation	Checkout latency increased	Opens investigation
E2	Observation	Payment authorization hop is slow	Supports H1

ID	Type	Statement	Impact
E3	Observation	Related deployment event exists	Supports H1, does not prove it
E4	Contradiction	Downstream health check is normal	Weakens H2
E5	Missing Evidence	Async trace segment unavailable	Limits confidence
E6	Memory	Similar prior reviewed pattern exists	Informs but does not confirm

Hypotheses

ID	Hypothesis	State	Evidence
H1	Recent change contributed to latency	Supported	E1, E2, E3, E6
H2	Downstream dependency degraded	Contradicted	E2 supports; E4 contradicts
H3	Instrumentation artifact explains the symptom	Proposed	E5 adds uncertainty; E1 challenges

State transitions

Transition	Trigger	Required behavior
H1 Proposed -> Supported	E1, E2, E3, and E6 align	Explain that support is not proof.
H2 Proposed -> Contradicted	E4 conflicts with downstream-degradation explanation	Surface contradiction before recommendation.
H3 Proposed -> Proposed	E5 leaves instrumentation uncertainty unresolved	Preserve unknown instead of forcing RCA.

Decision Packet

Recommended action: prepare a rollback review packet. Approval class: reversible action. Required operator: authorized service owner or incident commander. The assistant may draft the packet but MUST NOT execute the rollback.

Learning Record

Create replay seed, contradiction-handling fixture, missing-evidence fixture, and reviewed memory only after operator review.

Printable review checklist

Question	Pass condition
Can the reviewer identify the affected journey?	Checkout journey and payment authorization hop are visible.
Can the reviewer separate observation from inference?	E1-E3 are observations; H1-H3 are hypotheses.
Is contradictory evidence visible?	E4 weakens H2.
Is missing evidence visible?	E5 limits confidence.
Is consequential action gated?	Rollback remains a packet requiring approval.
