

Operational Intelligence Glossary Card

Canonical terms for the doctrine, reference architecture, and Operations Room.

Term	Definition
Operational Intelligence	The reasoning layer between enterprise telemetry and human decision.
Transaction Intelligence	Reasoning over customer, process, or business journeys rather than isolated components.
Evidence Graph	Typed graph of observations, sources, relationships, contradictions, missing evidence, inferences, and confirmed facts.
Observation	Operational data directly present in an approved source.
Inference	An interpretation derived from observations or other evidence.
Confirmed Fact	A statement accepted because it is sufficiently supported by evidence or operator review.
Contradiction	Evidence that weakens or conflicts with a claim, inference, or hypothesis.
Missing Evidence	Expected evidence that is unavailable, incomplete, stale, or inaccessible.
Hypothesis Lifecycle	Movement through proposed, supported, contradicted, rejected, or confirmed states.
Replay Seed	Minimum approved context needed to reproduce an investigation scenario.
Evaluation Gate	A release or responsibility boundary based on tested behavior.
Decision Packet	Reviewable recommendation with evidence, risk, reversibility, owner, fallback, and approval class.
Operator Control Plane	Human governance layer for approval, escalation, override, refusal, and accountability.
Operational Memory	Reviewed reusable context from incidents, decisions, patterns, outcomes, replay seeds, and lessons.

Boundary rules

Operational Intelligence starts when operational sources are converted into typed evidence for a decision path. It ends before human accountability is bypassed. Observability remains the signal source; incident management remains command and coordination; ITSM remains the service-management process.
